(54) Title: ON-LINE MARKETING SYSTEM AND METHOD

(54) Titre: SYSTEME DE MARKETING EN LIGNE ET PROCEDE CORRESPONDANT

(57) Abstract

The present invention provides a method and system that allows sellers (11) to communicate conditional offers to potential ouyers (15). The conditions include prices that depend on the aggregate amount of goods or services that buyers (15) collectively agree to purchase by a given time and date. The invention facilitates "demand aggregation", that is, aggregating demand by conveniently to offer "Demand-Based Pricing", that is, prices which go down as the volume of units sold in any given offer goes up. A seller (11a) can therefore offer volume discounts to buyers (15) acting as a group, even when the buyers (15) may not have any formal relationship with one another.

(57) Abrégé

L'invention concerne un procédé et un système qui permettent aux vendeurs (11) de communiquer des offres conditionnelles aux acheteurs potentiels (15). Les conditions comprennent les prix qui dépendent du volume global d'achats ou de services que les acheteurs (15) décident collectivement d'acheter à une date et une heure données. L'invention facilité le "regroupement de demandes", c'est à dire le regroupement des acheteurs potentiels (qu'ils se connaissent entre eux ou non) vis-à-vis des produits proposés par les vendeurs. Cette invention permet aux vendeurs (11) de proposer une "tarification basée sur la demande", c'est à dire de baisser les prix dans la mesure où le volume d'unités vendues pour une offre donnée augmente. Grâce à ce système, un vendeur (11a) peut proposer des tarifs dégressifs sur le volume aux acheteurs (15) agissant comme un groupe, et ce même si aucun lien formel n'existe entre lesdits acheteurs (15).

Description

WO 00/11570	PCT/US99/188

•	On-End marketing System and Medico
2	
3	Field of the invention:
4	The invention relates to electronic commerce utilizing the internet and more particularly
5	to a method and system for marketing products and services utilizing the internet.
6	
7	Background:
8	The world Wide Web has provided a convenient mechanism for marketing products.
9	Many web sites offer products for sale. Generally a potential customer viewing such a
10	web site indicates a desire to buy a particular product by "clicking" on a particular
11	location on the display screen. Some sites require a user to "register" by giving a
12	name, address and credit card information. Later when a customer desires to buy a
13	product the information entered during registration is used for billing and shipping.
14	Other sites allow a customer to enter billing and shipping information after the
15	customer has indicated a desire to purchase a particular product.
16	
17	Some web sites allow a buyer to bid on products that are offered in the internet's
18	equivalent of an auction. Other web sites allow a user to made an offer to buy
19	products at a price specified by the buyer, much as an individual might make an offer
20	to buy a product at a particular price in a face to face situation.
21	
22	Web sites such as those described above in essence utilize the internet to automate a
23	conventional buying process. The process takes place at great speed and the parties
24	may be remote, but the fundamental transaction is conventional.
25	
26	The present invention provides a new paradigm for conducting a marketing
27	transaction. Quantity pricing is conventional. However, in a conventional quantity
28	pricing situation, one buyer is offered a series of prices depending upon the number of
29	products purchased. The present invention utilities the idea of quantity pricing in a
30	new way. The present invention utilizes the internet to aggregate potentially unrelated
31	and potentially totally independent buyers into a buying group. By aggregating the
32	buyers, each buyer receives the advantage of quantity pricing.

VO 00/11570	PCT/US99/18879

ı	Summary of the Invention:
2	The present invention provides a marketing method and system that aggregates
3	demand and provides demand based pricing. With the present invention sellers can
4	communicate conditional offers to potential buyers. The conditions include prices that
5	depend on the amount of goods or services that buyers collectively agree to purchase
6	by a given time and date. The invention facilitates "demand aggregation", that is,
7	aggregating demand by potential buyers (who may or may not know each other), for
8	products offered by sellers. This invention allows sellers to conveniently offer
y	"Demand-Based Pricing", that is, prices which go down as the volume of units sold in
10	any given offer goes up. A seller can therefor offer volume discounts to buyers acting
11	as a group, even when the buyers may not have any formal relationship with one
12	another.
13	
14	Brief Description of the Drawings:
15	Figure 1 is an overall diagram of the system.
16	Figure 2 illustrates the elements on a web page for the preferred embodiment.
17	Figure 3 is a high level flow diagram of the various operations that take place.
18	Figure 4 is a program flow diagram of the a seller specifying an offer.
19	Figure 5 is a program flow diagram of presenting offers on a web site.
20	Figure 6 is a program flow diagram of a buyer joining a buying group.
21	Figure 7 is a program flow diagram of a offer being accepted.
22	Figure 8 is a program flow diagram of an offer being cancelled.
23	Figure 9 is an overall diagram of an alternative embodiment.
24	1
2.5	Description of Preferred Embodiments:
2ú	As used herein the following terms have the meaning given below:
27	"Product" means either a product or service.
28	"Demand Aggregation" - means consolidating demand by potential buyers for
29	products offered by sellers.
30	"Demand-Based Pricing" - means prices that go down as the volume of units sold
31	goes up.
32	"Buying Team" or "Buying Group" means a group of buyers who participate in a
33	given offer.
34	"Team Buying" or "Group Buying" - means multiple buyers coming together in a group
35	to buy products in volume,

WO 00/l 1570	PCT/US99/18879

5	ı	*Aggregate Demand" - means the total amount of products that buyers have indicated
	2	a desire to buy.
	3	"Demand Threshold" or "Aggregate Demand Threshold" — means the Aggregate
	4	Demand required for a product to be sold at a particular pnce.
10	5	"Maximum Demand Threshold" or "Maximum Aggregate Demand Threshold"
	6	means the Demand Threshold above which the price will not decrease further,
	7	irrespective of further increases in Aggregate Demand.
	8	"Buying Cycle" - means the period during which buyers can indicate a desire to
15	9	purchase a product. At the end of a buying cycle, the demand is aggregated
	10	(counted) to determine the price at which the product is actually sold.
	11	"Maximum Available Amount" means the maximum amount of a product that a seller
	12	is willing to sell during a Buying Cycle.
20	13	"System Operator" means an individual, company, party, entrepreneur or other entity
	14	that operates or is responsible for the computer system or web server that
	15	performs various calculations and operations hereinafter described.
	16	
25	17	An overall diagram of a first preferred embodiment of the invention is shown in Figure
	18	1. In general, the system connects sallers 11 with buyers 15 by means of a system
	19	controller 13. The sellers are designated 11a to 11x and are collectively referred to as
30	20	sellers 11. The buyers are designated 15a to 15x and are collectively referred to as
	21	buyers 15. There can be many buyers and many sellers; however, the actual numbers
	22	of buyers and sellers is not relevant so long as there is at least one seller and one
	23	buyer.
35	24	
	25	The sellers 11 communicate with the controller 13 via terminals 12 (individually
	26	designated 12a to 12x) and the buyers 15 communicate with the controller 13 via
	27	terminals 14 (individually designated 14a to 14x). Typically but not necessarily
40	28	communication is via the Internet. As is conventional, terminals 12 and 14 are
	29	connected to an ISP (Internet Service Provider) which provides access to the internet.
	30	Likewise controller 13 is connected to the internet via an ISP. The lines in Figure 1
	31	therefore represent logical information flow and not physical connections. The sellers
45	32	11 and the buyers 14 can be described as being online.
	33	
	34	Sellers' client terminals 14 can be any of the various types of terminals that are
	35 .	available such as computers, laptops, thin-clients, WehTVs, Interactive TVs, DDAs

WO 00/11570	PCT/US99/18879
-------------	----------------

5	1	Information Appliances, or any other device that can be used by sellers to access the
	2	system's controller 13 over a network, so sellers can specify offers of goods and
	3	services
	4	
10	5	The system controller 13 is one or more conventional network servers running
	6	software to keep track of sellers' offers (including optional conditions); "intelligently"
	7	control appearance of the offers on one or more physical or "virtual" media (e.g. web
	8	sites); and appropriately track and/or process purchase requests by buyers who may
15	٠ 9	see and respond to those offers.
·	10	
	11	The System Operator 13b utilizes a conventional client terminal to access and
	12	configure the system's controller 13 as is conventional with computer systems and
20	13	network servers.
	14	•
	15	The buyers' client terminals 14 are any of the various conventional terminals that are
	16	used to access web sites such as computers, laptops, thin-clients, WebTVs, two-way
25	17	TV, PDAs, information appliances, or any other devices that buyers can use to view of
	18	hear offers presented by controller 13. Buyers also respond to offers using client
	19	terminals 14.
30	20	
30	21	Figure 2 is a diagram illustrating the elements on a web page 21 which the controller
	22	13 presents to buyers 15. It is noted that Figure 2 merely illustrates the fields that are
	23	relevant to a preferred embodiment of the invention. Figure 2 is not meant to illustrate
35	24	the actual layout of a web page. An actual web page would be laid out in a creative,
	25	artistic fashion so as to present a pleasing visual appearance. The artistic nature of
	26	the visual appearance of the web page is not relevant to the present invention.
	27	
40	28	The fields or elements on web page 21 are:
	29	a) A conventional neading and logo 22 may be included to identify who is sponsoring
	30	the web page, however, such a field is not actually necessary to the operation
	31	of the system.
45	. 32	b) A field 23 which describes the product being offered for sale.
	33	c) A field 24 which lists the price of the product at various demand levels. For
	34	example, this field might indicate:
	35	2 to 5 \$10.00

WO	00/1	1570
----	------	------

PCT/US99/18879

5	1	6 to 20 - \$8.00
-	2	21 or more - \$4.00
	3	In this example, the Demand Thresholds are 2, 6, and 21. The lowest Demand
	4	Threshold is 2, meaning that the offer will be cancelled unless at least two units
10	· •	are sold. The Maximum Demand Threshold is 21, meaning that the price will
	6	not drop any lower than \$4.00 in this offer. The price will grop to \$4.00 only
	?	when buyers order, in aggregate, at least 21 units during the buying cycle.
	8	
15	9	This field can also specify a Maximum Available Amount. For Example, if the
	10	seller wanted to sell a maximum of 50 units (perhaps because only 50 items
	Li	were in the seller's inventory), then the quantities and price could be specified
	12	as:
20	13	2 to 5 — \$10.00
	14	6 to 20 - \$8.00
	15	21 to 50 \$4.00
	16	In this example, the Maximum Available Amount is 50.
25	17	
	18	d) A field 25 which indicates the Aggregate Demand so far for this offer, that is, the
•	19	total amount of the offered product that interested buyers have collectively
	20	indicated a desire to buy. Optionally this field may also indicate how many
0	21	individual buyers have thus far indicted a desire to buy the product. And this
	22	field may also optionally indicate the Maximum Available Amount level for this
	23	offer.
_	24	e) A field 26 which indicates the date and time when the buying process or cycle will
5	25	terminate.
	26	f) A field 27 for various status messages.
	27	g) A button 28 on which a user can "click" to indicate a desire to join the buying
•	28	process.
•	29	
	30	Web page 21 as described above relates to selling a single product. It should be
	31	noted that a single web page could offer multiple products. The fields described
5	32	above could be repeated, one set of fields for each product, or each field could have
	33	information on multiple products. Furthermore, in addition to having the fields
	1.34	described above the web page 21 could include numerous other unrelated fields with
	35 *	other unrelated information or advertisements.

5 Figures 3 is an overall flow diagram of the operation of the system. The process begins with a seller making an offer to sell a particular product at specified prices which depend upon the amount of the product that can be sold in a particular time 10 period (block 31). For example, a seller might indicate that he would sell a particular type of soccer ball at the following prices: 6 2 to 5 balls -- \$10.00 7 6 to 20 balls - \$8.00 8 15 21 to 50 balls -- \$4.00 9 In this example, the Demand Thresholds are 2, 6, and 21, the Maximum Demand 10 Threshold is 21, and the Maximum Available Amount is 50. The seller specifies all of 11 the above values. It is noted that the seller may choose not to specify a Maximum 12 20 Available Amount. If no Maximum Available Amount is specified then the last line in 13 the above example would read: "21 or more balls - \$4,00". 14 15 The seller might also specify that the buying cycle will last for 48 hours. That is, the 16 25 number of purchase requests at the end of 48 hours will determine the price at which 17 the item will be sold and no purchase requests will be accepted after 48 hours. The 18 seller could alternatively specify a date and time, such as December 15, 1999, 2pm. 19 20 30 Next, if the time or date limit of the offers has not passed (block 32) the system 21 displays the offer on one or more web sites (block 33). The display will have the 22 elements of information shown in Figure 2. A buyer who sees the offer on a web site 23 can then indicate a desire to join the Buying Team for this offer by "clicking" button 28. 24 35 25 At this point the buyer will provide billing and shipping information (unless it was previously provided during a registration process) and the buyer must indicate the 26 amount of product desired (block 34). This is the individual buyer's "demand" level for 27 28 this offer. 29 At this point the system checks (bock 35) to determine if the Buying Team's Aggregate 30 Demand (which is calculated by summing all of the buyers' individual demand levels 31 for this offer) is still less than the Maximum Available Amount previously specified by 32 45 33 the seller (block 31). (If the seller did not specify a Maximum Available Amount, the system considers the Maximum Available Amount to be unlimited, and considers the 34 answer to the question in block 35 to be "Yes". That is, the Aggregate Demand is

0 00/11570	PCT/US99/18879
) 00/11570	PCT

1	assumed always to be less than the Maximum Available Amount if no Maximum
2	Available Amount was specified.)
3	
4	If the Buying Team's Aggregate Demand is less than the Maximum Available Amount
5	(block 35) then the system goes back and checks if the time and date limits still have
ő	not passed (block 32). If the time or date limit still has not passed, the system
7	continues to present the offer on one or more web sites (block 33).
8	
9	If (at block 35) the Buying Team's Aggregate Demand is not less than the Maximum
10	Available Amount - i.e. if all of the items have been sold then the offer will be
11	accepted (block 37), and buyers and sellers will be notified.
12	
13	Note that, while Figure 3 shows the system checking the time and date limits (block
14	32) after a buyer joins a Buying Group, the system will additionally regularly check the
15	time and date limit (block 32), ideally checking every minute. (On computer operating
15	systems and environments like Unix, Windows NT, and Java, regular tasks like these
17	can be performed using and independent software process or thread that runs in
18	parallel with the rest of the system's processes or threads.)
19	
20	Any time the system checks the offer's date or time limits (block 32), if the offer's date
21	or time limit has passed (for example, if the seller specified that the offer must end by
22	2pm Dec. 25, 1999, and that time and date have passed), then the system proceeds to
23	check if any of the Demand Thresholds previously specified by the seller (block 31)
24	have been met or exceeded by the Buying Team's Aggregate Demand (block 36). To
25	do this, the system checks if the Aggregate Demand (which is the total amount of
26	product all of the buyers in the Buying Group have, collectively, expressed a desire to
27	buy) meets or exceeds the lowest Demand Threshold for the offer. In the soccer ball
28	offer example above, the lowest Demand Threshold was 2. (The seller offered to sell
29	2-5 balls for \$10.) So in that example, the system would check if all the buyers in the
30	Buying Team collectively expressed a desire to buy, in aggregate, at least 2 balls.
31	létha Anna an Daniar de la companya
3 2	If the Aggregate Demand does meet or exceed the lowest Demand Threshold (block
33	36) then the offer can be accepted (block 37) and the buyers and sellers are notified.
34 .	Otherwise the offer is cancelled (block 38) due to insufficient demand, and the buyers
35	and sellers are so notified.

WO 00/11570	PCT/US99/18879	

2	In a situation where offers are accepted (block 37) the buyers' credit cards are
3	charged, the product is shipped to the buyers, and commissions are calculated and
1	paid. If for example the system is being operated by one entity and the products are
5	actually being sold by a different entity, the system operator may receive a pre-
6	negotiated commission and the actual seller will receive the remainder of the selling
7	price.
8	
9	Detailed program flow diagrams of the operations shown in Figure 3 are given in
10	Figures 4 to 8. Figure 4 is a program flow diagram for the operation of the system as
11	the seller specifies an offer to sell a product. After the seller enters the web site (block
12	41) the seller registers (block 42) if he has not previously registered. In order to
13	register, the seller provides contact information and credit information (including social
14	security or business ID), so that the system operator can verify the seller's authenticity
15	and credit wortniness and (if the seller looks reliable) authorize the seller to have
16	access to the system. The system operator will provide the seller with an ID and
17	password so the seller can log into the system. In alternative embodiments, the
18	system's controller 13 (i.e. the system's computer servers, database, and server
19	software) can be set to automatically check the seller's credit history, and
20	automatically generate the Seller's ID and password or let the seller create his or her
21	own ID and password.
22	
23	After the seller is registered, the seller logs into the system (block 42), using his or her
24	ID and password, and indicates whether he or she would like to enter the specification
25	for a Team Buy Offer (i.e. to offer one or more units of a product or service to one or
26	more buyers), or modify the specification for a previously entered offer (block 43).
27	
28	If the seller chooses to enter a new Group Buy offer or modify a previously entered
29	one, the seller proceeds to enter a set of information that defines the offer.
30	
31	The seller starts by entering (or modifying) a description of the offer (block 44). For
32	example, the seller might provide text (or a recorded voice) saying, *200 Brand A
33	widgets for sale". Next the seller specifies a Maximum Demand Threshold and a
14	солтевропойну price (block 45). For example, the seller might indicate that a particular
3.5	widget will be sold for \$310 each if 200 can be sold during the offer. The seller can

WO 00/11570 PCT/US99/18879 also specify additional lower Demand Thresholds and prices. For example, the seller ı 5 could indicate that a particular widgets will be sold for \$325 each if the Aggregate Demand is 100 or more units but less than 200 units. That is, if potential buyers wind up expressing a desire to buy (in aggregate) between 100 and 199 units, the seller will sell those units for \$325 each, and if the potential buyers wind up expressing a desire 10 to buy (in aggregate) 200 or more units, the seller will lower the per-unit price to \$310 each. Finally a seller has the option of also Indicating a Maximum Available Amount of product available for sale during the offer. For example, if the seller only has 300 units in inventory, the seller could set the Maximum Available Amount level to 300. 15 10 The seller also specifies a date and time limit for this offer (block 48). For example, the 11 seller might indicate that if the lowest Demand Aggregation Threshold (100 units in the 12 above example) is not met by noon on a certain date, the offer will be cancelled. The 13 seller also has the option of not setting a date and time limit. However, providing a 14 date and time limit gives buyers an incentive to act sconer, and makes it easy -15 automatic, in fact - for the seller to cancel the offer if there is not enough demand to 16 25 satisfy the seller. 17 18 The seller can then choose to specify additional Group Buy Offers, or modify a 14 previously specified offer (block 47). After the seller enters an offer to sell, the system 20 13 presents the offer on one or more web sites (block 33) until the date or time limit 21 passes (block 32) or the Aggregate Demand rises to the Maximum Available Amount 22 (block 35) specified by the seller (blocks 45 and 46), if one was specified. In the 23 preferred embodiment, the system 13 presents one or more sellers' offers on one or 24 more web sites with web pages similar to web page 21. The web pages are accessed 25 26 by buyers 15 through terminals 14a to 14x. 27 Presenting an offer on a web site involves displaying several pieces of information 28 associated with the offer. In the preferred embodiment, the system 13 presents offers 29 on one or more web sites as in accordance with the program flow diagram shown in 30 Figure 5. For each offer presented, the system will display the following information as 31 entered by the seller or as calculated by the system controller 13: the offered product's 32 description (block 51); the Demand Thresholds and associated Prices (block 52) and 33 the Maximum Available Amount (if one was specified by the seller); the Aggregate 14 Demand so far (block 53) - i.e. the total amount that potential buyers have expressed 35 '

30

35

45

an interest in buying (in aggregate) since the start of the offer; and optionally, the number of buyers in the Buying Group so far (block 53); the date and time limit for the 2 offer (block 54) as entered by the seller (46); an optional status message (block 55) 3 (e.g. "Just 2 days left! We need to sell twelve more units to get the best discount price!"); and a "Join Buy Team" button (block 56) that potential buyers can dick if they are interested in joining the buying group for this offer. In an alternative embodiment, 6 potential buyers can click on another part of the screen displaying the offer to indicate 7 their interest in participating in the offer. In such an embodiment, the "Join Buy Team" 8 button would be optional. (The "Join Buy Team" button can also go by other names, ç such as "Buy Now" or simply "Buy".) 10 H Figure 6 is a program flow diagram of the operations that occur when a potential buyer 12 joins a buying team (Block 34). If a potential buyer sees an offer displayed on a web 13 site (block 61), and wants to participate in the offer, the potential buyer can indicate a 14 desire to join a Buying Group (62 and 62b) by clicking on the "Join Buy Team" button. 15 in that case, the system proceeds to walk the potential buyer through the process of 16 signing up to join the Buying Group for this offer (also known as the "Buying Team" in 17 18 this document). 19 The system will present forms (block 64) to collect information from the potential buyer. 20 presenting the forms either on the same web page where the offer was presented or 21 on separate web pages linked to that first web page. The buyer enters the amount 22 (e.g. the volume or number of units) they are interested in buying if this offer goes 23 through (block 65). This is the potential buyer's individual "demand" level. For 24 example, if the offer is for soccer balls, the user might indicate an interest in buying 5 25 balls. The potential buyer also provides his or her billing information (for example, 26 credit card number and expiration date and billing address), shipping address, and 27 contact information (block 66). Preferably an e-mail address is provided as part of the 28 contact informatic >. The potential buyer then gets a chance to confirm whether he or 29 she really wants to join the Buying Group after all (block 67). 30 31 When the potential buyer confirms his or her interest in joining the Buying Group (block 32 67b), then the system stores the collected data in a central database (part of the 33 software on the servers 13) and the system recalculates the Aggregate Demand for 34 this offer (block 68). The Aggregate Demand is the sum of each Buying Group

50

45

5

10

15

20

25

30

1	member's individual demand level. For example, if there are three members in a
2	Buying Group so far for the Soccer Ball example mentioned earlier, with the first
3	
1	ball, and third indicating an interest in buying 20 balls, then the Aggregate Demand so
5	far is 5+1+20 = 26 balls. If the seller is selling wheat instead of soccer balls, then the
6	Aggregate Demand might be expressed in lbs. of wheat instead of # of balls. Likewise
7	the demand could be in terms of hours of a particular service that is being offered.
8	·
ŋ	The system will not allow a buyer to request more units than are available - i.e. more
10	units than the Maximum Available Amount specified by the seller, factoring in the
11	Aggregate Demand already expressed by other Buying Group members plus the
12	number of units requested by the new potential buyer. If the new potential buyer
13	requests too many units, the system will display a message on the web site telling the
14	new potential buyer how many units are left, and then allow the new potential buyer to
15	re-enter a lower desired number of units (block 65). Naturally in some situations a
16	seller might have a virtually unlimited number of units available if at least a certain
17	number of products are ordered.
18	
19	As described earlier, and as indicated by blocks 32, 35, and 36, the system monitors
20	aggregate demand, and time and date limits, during each offer's buying cycle. If the
21	Buying Team's Aggregate Demand rises to the Maximum Available Amount (block 35)
22	for an offer, or if the time or date limit has passed (block 32) but Aggregate Demand
23	has risen to at least the lowest Demand Threshold (36) by that time, then the system
24	proceeds to the "Offer Accepted" stage (block 37). However, if the time and date
25	threshold pass (block 32), and the Aggregate Demand is still below the lowest
26	Demand Threshold (block 36) at that time, then the system proceeds to the "Offer
27	Cancelled' stage (block 38).
28	
29	For example, suppose a seller offered 250-49% soccer balls for \$15 each or 500-700
30	soccer balls for \$10 each, with a Maximum Available Amount of 700. If the Aggregate
31	Demand (that is, the total number of balls collectively desired by all members of this
32	offer's Buying Group) reaches 700 (the Maximum Available Amount) before the Date &
33	Time limit pass, the system would recognize that (block 35) and proceed to the "Offer
34	Accepted stage (block 37). If the Date & Time limits pass (block 32) and the
35	Aggregate Demand has reached 265 (higher than the lowest Demand Threshold of

250), then the system would recognize that (block 36) and also proceed to the "Offer Accepted" stage (block 37). But if the Date & Time limits pass (block 32) and the 2 Aggregate Demand has only reached 112 balls by then (less than the lowest Demand Threshold of 250), then the system would recognize that (block 36) and proceed to the 1 "Offer Cancelled" stage (block 38). 6 In the "Offer Accepted" processing stage (the programming block diagram of which is 7 shown in Figure 7), the system first stops presenting the offer (block 71) anywhere it × had been presenting the offer. The system displays a message on those web sites indicating that the offer had been completed successfully. 10 п The system then uses the Aggregate Demand (calculated at block 68), and the set of 12 Demand Thresholds and associated prices provided by the seller when setting up the 13 offer (block 31), to determine the final price each buyer will have to pay for the product 11 15 being offered (block 72). 16 For example, if a seller offered 250-499 soccer balls for \$15 each or 500-700 soccer 17 balls for \$10 each, and if the Buying Group members express a desire to buy (in 18 aggregate) 272 soccer balls (i.e. their Aggregate Demand is 272), then the price they 19 20 would have to pay would be \$15 per ball. But if the Aggregate Demand by the end of 21 the offer period met or exceeded 500 units, they would only have to pay \$10 per ball. 22 After determining the final price (block 72), each potential buyer is charged (block 73) 23 using the credit card information previously supplied by each buyer (block 66). Each 24 buyer is charged the price times the number of units they are buying (as they indicated 25 previously in block 65), plus any applicable tax and shipping & handling charge (if 26 any). The system keeps track of which buyers were successfully charged. In some 27 cases, credit card charges may not go through - for example, if a potential buyer's 28 credit card has expired or is over its credit limit. In alternative embodiments, the 29 system can automatically create invoices for buyers who prefer to be billed rather than 30 31 paying by credit card. 32 The system notifies the seller that the offer has gone through, and provides the 33 shipping and contact information for each successfully charged Buyer (block 74). The 34 seller then ships the number of units requested by each successfully charged buyer 35

50

5

10

15

20

25

30

35

1	(block 65) to that buyer. In alternative embodiments, the Seller could ship all of the
2	units, in bulk, to a fulfillment company or to the System operator, who would handle
3	shipping subsets of the units to individual Buyers.
1	
5	In the case where the thing being purchased is a service, rather than a product, the
6	seller would perform the purchased service for the buyer, rather than shipping any
7	product.
8	
y	Finally, successfully charged buyers are notified that the offer has been accepted, that
10	they have been charged, and that the products are on their way (block 75). Potential
11	buyers who were not successfully charged are notified (block 75) about the
12	unsuccessful charge and no product is shipped to them.
13	
14	As described above, if an offer's Time & Date limit passes (block 32) and Aggregate
15	Demand is still below the lowest Demand Threshold (block 36), then the system
16	proceeds to the "Offer Cancelled" processing stage (block 38). When this occurs, the
17	system stops presenting the offer (block 81) anywhere it had been presenting the offer
18	The system can display a message on those web sites indicating that the offer has
19	been cancelled. The seller is notified that the offer has been cancelled because of
20	insufficient demand (block 82). Finally, potential buyers who had expressed interest in
21	joining the Buying Group for this offer are notified that the offer has been cancelled
22	because of insufficient demand (block 83).
23	
24	The embodiment illustrated in Figure 1 displays the offers on a web site run by the
2.5	System Operator on a web server that is part of the system controller 13. For
26	example, if XYZ Corp. wanted to offer group discounts on their own web site, using
27	their own software to manage the process, they would implement a system like the
28	one illustrated in Figure 1. The embodiment shown in Figure 1 could also be used to
29	display offers on more than one web site hosted on the same servers used for the
30	system controller 13.
31	
32	Various other alternative embodiments of the invention are possible. Figure 9
33	illustrates one alternative embodiment of the invention. Figure 9 illustrates an
34	embodiment of the system that displays offers on one or more web sites (usually more
	•

than one) run by other web-site operators who may differ from the System Operator, on web servers that are not part of the system controller 13. 2 ٦ For example, if ABC Corp. wants to present Group Buy offers on a network of affiliate 1 web-sites (BBB Corp. site, CCC Corp. site, and others), ABC Corp. would use the 5 10 embodiment shown in Figure 9. The embodiment shown in Figure 9 includes an extra ń layer of external web-sites and web-site operators. This embodiment can be used to display offers on one or more (i.e. multiple) web-sites 95 (generically referred to herein as media generators) run by parties 94 other than the System Operator 93b. Thus, 9 15 four different parties can be involved in each potential sale. There is a seller 91, a 10 System Operator 93b, a web site operator 94, and a buyer 97. 11 12 If the parties are all distinct from one another, the System Operator 93b and each 13 Media Generator Operator 94 will (in a preferred version of this embodiment) receive a 14 commission or royalty on each sale facilitated through each Media Generator 15 Operator's web site 95. Using the above example, ABC Corp. could create a Group 16 Buy offer for a certain product, using a system like the one illustrated in Figure 9 17 (operated by a potentially unrelated Operator 93b) to present those offers on multiple 18 affiliate web sites including BBB Corp.'s web site and CCC Corp.'s web site. If enough 19 demand is aggregated in time for that Group Buy offer to be accepted, then the 20 System's Controller 93 will charge the buyers (including shipping and sales tax), pay 21 BBB Corp. and CCC Corp. a commission based on the number of items sold through 22 their respective web sites during this offer and the price of those items (or a fixed 23 amount per item), retain another commission for the System's Operator 93b based on 24 the total number of items sold through this offer and the price of those items (or a fixed 25 amount per item), and pay the Seller 91 the remainder. 26 27 Naturally while all the different parties may be unrelated, in some situations some of 28 the parties may be somenow related or in fact may by the same entity. One important 29 example would be a Seller who wants to offer Group Buy offers through its own web 30 sites, using a System Controller 93 that is run by an outside System Operator 93b. In 31 this case the Media Generator Operator 94 and the Seller 91are the same entity. The 32 System's Operator 93b is a separate entity, offering its services (the ability to run 33 Group Buy offers) to the Seller, in this case, when offers are accepted, the System's 34 Controller 93 would simply retain a commission for the System's Operator 93b, and

14

55

20

25

30

35

45

50

55

pay the Seller the remainder (rather than having to pay an additional commission to 1 unrelated Media Generator Operators). 2 3 The embodiment shown in Figure 9 includes media generators 95 and media generator owners or operators 94. In this embodiment sellers 91, sellers terminals 92 5 system controller 93 and buyer's terminals 96 are similar to the corresponding 6 elements shown in Figure 1. 8 Media generators 95 are conventional internet web-server(s) that accept information 4 from system controller 93 and respond by displaying one or more of sellers' offers on 10 some part of a web site (where display can change for each viewer over time), and by 11 accepting input from buyers who may respond to those offers. The media generator 12 owners or operators 94 are web-site owners or operators who choose to have system 13 controller 93 present offers and accept buyer responses through parts of their web 14 15 sites. The media generators 95 are run by one or more operators 94. One or more potential buyers 97 can then view the offers on the web sites using their web browsers 16 (96). In the preferred embodiment, either the seller 91 or the System Operator 93b or 17 the operators 94 of the media generators 95 can configure the system to display either 18 all offers currently being managed by the system controller 93 or some subset of those 19 20 offers. 21 In other alternative embodiments, the offers can be displayed on various kinds of 22 "media generators" 95 besides standard web sites - media generators being 23 24 interactive presentation devices like hand-held devices, interactive television, cell phones, and so on. 25 26 In one atternative embodiment, the system periodically checks if an offer's time and 27 date limit is near. If it is, and if there are almost enough potential buyers to reach the 28 next Demand Threshold for the offer, then the system automatically notifies the current 29 Buying Group members that they should tell their friends and family about the offer in 30 order to get more Buyers to join the Buying Group. For example, the system could e-31 mail a message stating something like, "We just need 5 more people to join the Buying . 32 Team in order to get the Soccer Balls for only \$10 each...Tell your friends!". This 33 information can also be displayed on any web page where the offer is displayed, and 34 the system can also display a "Tell your friends" button next to a box where people can 35

5

10

15

20

25

30

35

45

50

55

type their friends email addresses. When the button is clicked, the friends are sent an email message telling them about the offer and telling them how to join the Buying 2 Group. 1 The preferred embodiment of this invention described above allows one or more sellers to present one or more Team Buy offers to one or more potential buyers ó through one or more web sites. An alternative embodiment will be a simpler embodiment in which a single seller offers a volume discount on one product to one or more buyers through the seller's own web site. For example, an online retailer company (hereinafter referred to as XXE) could use this simpler embodiment of this 10 invention to offer a volume discount on XXE's own web sites using the system of the 11 present invention to present the offer. For example XXE could offer a toy with the 12 description "Mr. XYZ at half off if we sell 200 units by Tuesday!". A system in 13 accordance with the present invention would automatically accept indications of 14 interest (i.e. aggregate demand) from one or more people who are interested in joining 15 the Buying Group for that offer. 16 17 Other embodiments of the invention could also allow sellers or the system operator 18 13b to place more constraints on the offers. For example, they might place a limit on 19 how many units any single buyer can request. For example, a soccer ball retailer who 20 is offering a great deal on soccer balls in order to attract new customers might limit 21 potential buyers to 2 balls each, so as to attract many new customers, rather than 22 allowing just one or two customers to buy all of the soccer balls at the great price. 23 24 In still other embodiments of this invention, sellers could specify different types of 25 thresholds. For example, sellers could offer a special price if enough people agree to 26 purchase exactly 500 units (in aggregate) of a given item (e.g. because the seller has 27 exactly 500 units to sell). Or they could offer a special price if potential buyers agree 28 to purchase at least 500 units (in aggregate) if the deal goes through (e.g. because the 29 30 seller has more than 500 units available for sale); 31 Another embodiment of the present invention allows sellers to set both a minimum 32 number of buyers as well as a minimum volume of goods or services sold, and allows 33 the seller to set limits on the amount any one buyer could buy for a given offer. For example, a seller might offer 500 computer moderns, and specify "maximum of two 35

moderns per person". Alternatively a seller might offer 300 passes to an amusement park, requiring 300 individual buyers (rather than allowing more than one pass per any given buyer). In another alternative a seller might offer 200 modems to up to 100 buyers (either without specific restrictions on the number each buyer could buy, or with a limit of, say, up to 5 moderns each). 6 ? Still other embodiments of the present invention can allow sellers to offer services as well as goods. For example, "I'll wash 100 cars for \$5 each." or "Our law firm will do × incorporation work for 200 companies, at only \$1000 per company* 9 10 In yet another embodiment, the system could allow buyers to express an interest that 11 is conditional. That is, the system can allow a buyer to specify that the buyer will buy 12 the product only if the demand is sufficient to lower the price to a particular level. In 13 such an embodiment, the system would have a "buy button" as shown in Figure 2 and 14 one or more additional buttons that would allow a potential buyer to indicate that the 15 order being placed is conditional upon the price reaching a particular level associated 16 with the particular button. 17 18 The method and apparatus of the present invention have applications on the Internet 19 as well as in conventional communications systems such as voice teleptiony and other 20 communications systems such as two-way television (a.k.a. interactive television) and 21 WebTVs. Any device that can present information (visually, audibly, or otherwise) can 22 be used to present offers. Any device that can accept input from people (directly or 23 indirectly through other devices) can be used to accept indications of interest. 24 25 The preferred embodiments of this invention utilize the internet and standard computer 26 tools used to build high-scale Internet-based services that include financial 27 transactions. Several companies, including Microsoft Corporation, Netscape 28 Communications, and Oracle, provide commercially available tools and documentation 29 that are frequently used by programmers to implement high-scale web applications. A 30 skilled programmer with access to these tools and documentation could follow the 31 specifications described herein and build a system that utilizes the present invention. 32 33 The term "system operator" as used herein does not necessarily refer to an individual. 34 35 The term refers to and entity or enterprise (which could be an individual) who operates

5

10

15

20

25

30

35

40

45

the System Controller 13 (or 93) that accepts orders and makes the previously described calculations. In the embodiment shown in Figure 1, the system operator's server also hosts the web pages that are viewed by potential buyers. In the ; embodiment shown in Figure 9, the web pages viewed by potential buyers are hosted on servers that can be owned an operated by individuals or entities that differ from the entity that owns or operates the server that hosts the controller 93. 6 The products offered for sale using the various embodiments of the invention can be X products that are offered for sale by the System Operator. Alternatively, the System ij Operator can merely provide facility that is used by others to offer products for sale. If 10 it is the System Operator that is offering products for sale, when an offer is accepted. 11 the System Operator (or an agent of the System Operator) will ship the product to the 12 buyer. If the System Operator is merely providing a facility for others to offer products 13 for sale, when an offer is accepted, the product will typically be shipped to the Buyer 14 by the actual Seller (or by an agent for the Seller). In such a case the System 15 Operator will only receive a commission for operating the system and the remainder of 16 the purchase price will go to the actual Seller. 17 18 In the embodiments thus far described, the buyers are charged by means of a credit 19 card. Other alternative methods of payment can also be used. For example, the seller 20 could invoice the buyer, or potential buyers could be required to maintain a deposit 21 account with the system operator. In yet other embodiments, various other payment 22 mechanisms could be employed. 23 24 The System Operator can be an entrepreneur who owns and operates a computer 25 system and business that allows sellers to display conditional offers to buyers and 26 27 which handles the associated computations and data base operations. Alternately, the System Operator may be an entrepreneur who merely conducts the business 28 operations and who rents space on a computer or web server owned by another party 29 who handles the computer operations for the business. The term System Operator is 30 herein used to refer to the person, company or entrepreneur responsible for the overall 31 operation of the system irrespective of whether or not the System Operator owns and 32 operates system controller 13 (or 93) or if there is some other the business relationship 33 between the entrepreneur responsible for the system and the party or entity that owns 34

:	or operates the actual computer systems and web servers that provice the functions of
2	system controller 13 or 93.
3	·
4	It is also noted that in the embodiment shown in Figure 1, the system controller 13
5	consists of server hardware running database software, software for performing the
ó	logic in Figures 3 to 8, and web server software for hosting one or more web sites. In
7	the embodiment shown in Figure 9, the system Controller 93 includes the nardware,
×	database software, and software to perform the described logical operations, but (as
y	illustrated) it does not necessarily include web server software. Instead as illustrated
10	in Figure 9, the system controller 93 communicates with outside server hardware 95
11	that runs web server software. It is however noted that, optionally, one or more of the
12	media generators 95 could in fact be in the same physical hardware as the system
13	controller 93.
14	
15	It should be understood that while various preferred embodiments of the invention
16	have been described, those skilled in the art could make various changes in form and
17	detail without departing from the spirit and scope of the invention. Applicant's
18	invention is limited only by the scope of the appended claims.
